Student Exploration: Ants on a Slant (Inclined Plane)

Prior Knowledge Questions (Do these BEFORE using the Gizmo.)

1. Imagine you were lifting *very* heavy jugs to the top of a house. You can either use the stairs on the left or push them up the **inclined plane** on the right. Which option is easier? Why?

_____

2. If a person in a wheelchair wanted to get to the second story of a two-story building, would it be easier to take a short, steep ramp or a long, shallow ramp? Explain.

_____

Gizmo Warm-up

1. In the *Ants on a Slant* Gizmo™ ants use a slanted stick to help push food to the top of a tree stump. Drag the **stick** sideways to change its steepness. Change the number of **ants** by dragging them to the item. Then click **Play** ( ) to see if the ants can lift the item.

   First, describe a strategy to find out which items are heavier than others.

   _____

   _____

   _____

2. List the food items in order, from lightest to heaviest, using your method:

   (lightest) _____, _____, _____, _____ (heaviest)

Activity A: **Inclined planes: pros and cons**	Get the Gizmo ready: • Click **Reset**. • Make sure **No friction** is selected.	
Question: What are advantages and disadvantages of using inclined planes to help lift?

1. Observe: Run a few trials with the Gizmo. Explore both shorter (steeper) and longer (flatter) sticks. Why do you think people (or ants) would choose to use an inclined plane to help lift?

   _____

   _____

2. Predict: Make two predictions below. (Stick lengths in the Gizmo: 10, 15, 20, 25, and 30 cm.)

   A. Which stick length will let you lift a peanut with the *fewest* ants? _____

   B. Which stick length will require the *longest* time to lift a peanut? _____

3. Experiment: Test your predictions. Use all five stick lengths to lift a **peanut**. List results here.

	10 cm	15 cm	20 cm	25 cm	30 cm
Minimum ants needed to lift peanut					
Time needed to lift the peanut					

4. Draw conclusions: Name an advantage and a disadvantage of using an inclined plane.

   A. Advantage: _____

   _____

   B. Disadvantage: _____

   _____

5. Analyze: The stick doesn't just support the peanut; it actually *pushes up* on it! (Think of what would happen if the stick suddenly disappeared.) This pushing up is what "helps" the ants.

   A. Which kind of inclined plane pushes up *more*? (Circle one.) Steeper Flatter

   B. What do you think causes this? _____

   _____

Activity B: **Work, work, work**	Get the Gizmo ready: • Click **Reset**. • Make sure **No friction** is selected. • Select the **blueberry**. • Select the 10-cm stick (shortest, steepest stick).	

Question: How does length of an inclined plane affect the force needed to lift an object?

1. Form hypothesis: Suppose you already know how many ants it takes to lift an object straight up (using the 10-cm stick). How can you predict the number of ants that will be needed to lift the object with an inclined plane of a certain length?

   Hint: Play with the Gizmo. See how doubling the length changes the number needed.

   _____

   _____

   _____

2. Collect data: How many ants can lift the **blueberry** straight up (using 10-cm stick)? _____

3. Predict: Use your hypothesis to predict what is the *smallest* number of ants required to lift the **blueberry** on sticks of other lengths:

   15-cm stick _____ 20-cm stick _____ 30-cm stick _____

4. Experiment: Test your predictions in the Gizmo. How many ants are needed for each?

   15-cm stick _____ 20-cm stick _____ 30-cm stick _____

5. Calculate: The **work** used to lift an item equals the force needed times the distance moved. You can estimate work by multiplying the number of ants times the stick length.

	10 cm	15 cm	20 cm	30 cm
Ants required (minimum number)				
Approximate work (ants x length)				

6. Draw conclusions: How does using an inclined plane affect the work required to lift an item?
