Patient's Chief Complaint:

Patient indicated that he has been struggling with his self-confidence due to confusion of his identity. He does not know if he is an animal or a plant.

Patient's History:

Patient has recently gained employment as an exterminator. The patient has had difficulty relating to peers in the past and continues to exhibit anxiety and lack of self-esteem as a result of working with colleagues. The patient indicated that his coworkers told Mr. Roachkiller, his supervisor, that he has been taking extra-long lunch breaks. The patient explained that his coworkers claim that he is not an animal and does not need to take extra-long lunch breaks. The patient stated that he feels like an animal due to the following reasons:

- He ingests a large number of flies, crickets, and other insects on a regular basis.
- He has feelings. He is aware of when insects are near his "mouth".
- He and Mrs. VonFlytrap have a happy family of 4. Mrs. Flytrap is expected to have new editions to the family in the spring.

Referrals/Tests/Treatments:

Physical examination shows no abnormality with the patient's body. The patient's leaves and stem are all in optimum health. The patient is receiving adequate levels of sunlight and water. However, lab samples indicate that Mr. VonTrap is deficient in nitrogen compounds in the root area. Mr. VonTrap submitted a photo of Mrs. VonTrap and his children. (Included in profile)
